Problem indicated	Severity	Notes
Lack of Startup Screen	2	Add in a title to the start screen to look better and introduce the application of app better.
Duplicate Report Number	4	When viewing submitted reports we get a duplicate Report Number 00001. Need to fix this because impairs functionality of view map and historical report data.
Update Email Validation	2	Email validation not implemented when trying to update user profile.
Missing Historical Report	5	Implementation missing, customer will be mad.
View Quality Report Feature not working	5	Ability to view the Quality report after logging as a manager does not work.
View Map Bug	3.5	Unable to display map when quality report and submitted report do not load.

Criteria	Points	Note
Visibility of System Status	6	Does not show system status at all.
Match between System and real world	6	Too minimal design to be used in real world
User Control and Freedom	9	Good navigation, easy to follow with simple buttons
Consistency and standards	7	Consistent and has standards in color and design and organization. But inconsistent in worker and manager and user button sizes that is very apparent.
Error Prevention	7	Little to no error, so prevention not really needed. And manpower took care of most error already.
Recognition rather than recall	6	Little to no recognition of bugs and error, just ignores it and walks around acting its inspected
Flexibility and efficiency of use	8	Not really flexible but definitely efficient to use since its so simple.

Aesthetic and minimalist design	8	Nice Blue color, but a little too minimal in design, can make really good.
Help users recognize, diagnose, and recover from errors	5	Little detection of error, hard to recover registered username and password.
Help and Documentation	6	Should better show transition from successful registration to back to home screen. Why not just go to application screen?

#### Analysis:

The app overall is very well made with the key concept of being blue and carrying out the simplicity of the app. There are a few minor bugs and validation checks that must be performed. Some big implementation features not working also. Can make a lot of improvement in usability for a user with more navigation pop ups and recognizing where the user is actually
